

Ask your pharmacist any questions you may have regarding your prescription.

Remember:

You can save big \$\$ with Generics!

Always ask your physician or pharmacist if you may take a generic equivalent drug when being prescribed a medication. The following are facts about generic medications that you may not know:

Generic medications have the same effect on the body as brand name medications. Generics must produce the same effect in the body and have the same active ingredients, strength and absorption rate as brand names.

You can easily find if your prescription is available generically simply by asking your doctor or pharmacist.

The majority of generic medications are really manufactured by the same companies that manufacture the brand name medications. According to the FDA, brand name manufacturers account for almost 75% of all generic medication production, actually making duplicate versions of their own or other companies' brand-names, but selling them under a generic name.
